A Solutions Report is a list of startups around a certain topic or technology. The list includes information on each startup which includes:

- The TDP ID code
- The startup's name
- How the startup tags itself
- A brief summary statement of operations
- Product description
- The URL to the startup's website
- The age of the startup
- How much money the startup has raised

TDP generated algorithm scores for data completeness, data validity, execution, survivability, and overall score. These algorithms are scored out of 10 (100 for overall score). TDP looks across many data points per startup, the data completeness score is what percent of the data does TDP have for that startup (i.e. 4.8 = 48%).

- **The data validity score** takes into account data age to determine how accurate the TDP data is for the startup
- **The execution score** is how likely can the startup deliver on what it says it can do
- **The survivability score** estimates if the startup is survivable over time
- **The overall score** takes into account all the scores, funding, and other data points to summarize the startup into one number

The list is then organized into three tiers based on the overall scores and statistical thresholds. The ranking is based on the overall quality of the startup.
